

Actions

- They're callbacks, they're functions.
- They're passed down as data (functions are data)
- They're invoked later (usually by a user action)
- `{{action}}` is a function helper for *scoping* and *lookup*.
 - scoping on the current template context
 - lookup, string => actions hash of js, reference on js

*Use actions as callbacks,
don't use return values for state*
